ACKNOWLEDGEMENT

I would like to express my sincere gratitude to everyone who supported me in the successful completion of this project, ***"Testing and Analysis of SevaLinkCare"***

First and foremost, I am deeply thankful to my subject teacher for providing valuable guidance, continuous support, and constructive feedback throughout the project. Their insights helped me understand the practical aspects of software testing and quality assurance.

I would also like to thank my institution for giving me the opportunity to work on this project and enhance my technical and analytical skills. The resources and learning environment provided played a crucial role in completing this work effectively.

I extend my appreciation to my friends and peers for their support, suggestions, and motivation during the project development and testing phases.

Lastly, I would like to thank my family for their constant encouragement and support, which helped me stay focused and complete this project successfully.

This project has been a great learning experience, allowing me to gain practical knowledge in functional, validation, usability, and responsiveness testing.

— Akash Kumar

ABSTRACT

This project focuses on the **Testing and Analysis of SevaLinkCare** healthcare website. The primary objective of this study is to evaluate the usability, functionality, responsiveness, and overall performance of the website through manual testing techniques. **Sevalinkcare** is a web-based healthcare platform that offers essential services such as ambulance booking, doctor-on-call support, and emergency healthcare assistance. Since the platform is intended for critical and time-sensitive services, it is important to ensure that its user interface is reliable, easy to use, and free from errors.

The project begins with a detailed examination of the website's interface by performing testing on various components such as buttons, input fields, forms, hyperlinks, images, and navigation menus. Each element is carefully tested to verify whether it behaves according to the expected requirements. The functionality of key features, such as booking services and submitting forms, is also validated to ensure smooth user interaction. In addition, the visual design of the website is analyzed to check for consistency in layout, alignment, font usage, and color schemes across different pages.

Another important aspect of this project is testing the responsiveness of the website. The application is examined on different screen sizes and devices, including desktops and mobile devices, to ensure that the interface adapts properly without affecting usability. Input validation is also tested by entering valid and invalid data into forms to verify whether appropriate error messages are displayed and whether the system prevents incorrect data submission.

To conduct testing in an organized and systematic manner, a set of well-defined test cases is created based on real user scenarios. These test cases help in verifying the expected behavior of the application under different conditions. During the execution of these test cases, any discrepancies between expected and actual results are identified and recorded as defects or bugs.

All identified issues are documented and tracked using Jira, a widely used bug tracking and project management tool. Each bug report includes detailed information such as a unique identifier, description of the issue, steps to reproduce, expected outcome, actual outcome, and priority level. This structured approach helps in managing and monitoring defects effectively throughout the testing lifecycle.

The results obtained from this project provide a clear understanding of the strengths and weaknesses of the **Sevalinkcare** website's. It also highlights areas that require improvement to enhance user satisfaction and system reliability. Overall, this project demonstrates the significance of GUI testing in delivering high-quality web applications, especially in the healthcare domain where user experience and accuracy play a crucial role.

CHAPTER 1

INTRODUCTION

1.1. Project Overview

This project is based on the **Testing and Analysis of SevaLinkCare** healthcare website using manual testing techniques. The main purpose of this project is to analyze and evaluate the website's user interface to ensure that it is functioning correctly, easy to use, and free from major defects. **Sevalinkcare** is an online healthcare service platform that provides facilities such as ambulance booking, doctor consultations, and emergency medical support. As it deals with essential healthcare services, the website must deliver a smooth and reliable user experience.

In this project, a detailed study of the website is performed by testing different graphical elements such as buttons, forms, links, navigation menus, and overall page structure. Each component is checked to verify whether it performs the expected action when used by the user. The project also focuses on identifying usability issues, such as confusing navigation or improper layout, which may affect the user experience.

The testing approach used in this project is manual testing, where test cases are designed and executed based on real-world user scenarios. These test cases help in verifying the correctness and behavior of the system under different conditions. During the testing process, any mismatch between expected and actual results is identified as a defect or bug.

To manage and track the identified bugs, Jira is used as a bug tracking tool. All defects are recorded with proper details such as description, steps to reproduce, expected results, and actual results. This helps in organizing the issues and understanding their impact on the system.

Overall, this project provides a practical understanding of GUI testing, test case design, and bug tracking. It highlights the importance of testing in ensuring the quality, usability, and reliability of a web application, especially in the healthcare domain where user satisfaction and accuracy are critical.

1.2. Objective

The main objectives of this project are to perform comprehensive **Testing and Analysis of SevaLinkCare** healthcare website using manual testing techniques and Jira. The project aims to evaluate the overall functionality, usability, and performance of the website interface by testing various graphical components such as buttons, forms, navigation menus, and links.

- To perform Testing and Analysis of Sevalinkcare website and evaluate its user interface components such as buttons, forms, links, and navigation menus.
- To verify the functionality of different features and ensure that each element works according to the expected behavior.
- To identify bugs and defects present in the website during the testing process.
- To design and execute test cases based on real user scenarios for systematic testing.
- To check the usability of the website, ensuring it is user-friendly and easy to navigate.
- To test the input validation of forms by providing valid and invalid data.
- To analyze the responsiveness of the website on different devices such as mobile and desktop.
- To use Jira for effective bug tracking and management throughout the testing lifecycle.
- To improve understanding of manual testing techniques and their real-world application.
- To ensure the overall quality, reliability, and performance of the website interface

1.3. Motivation

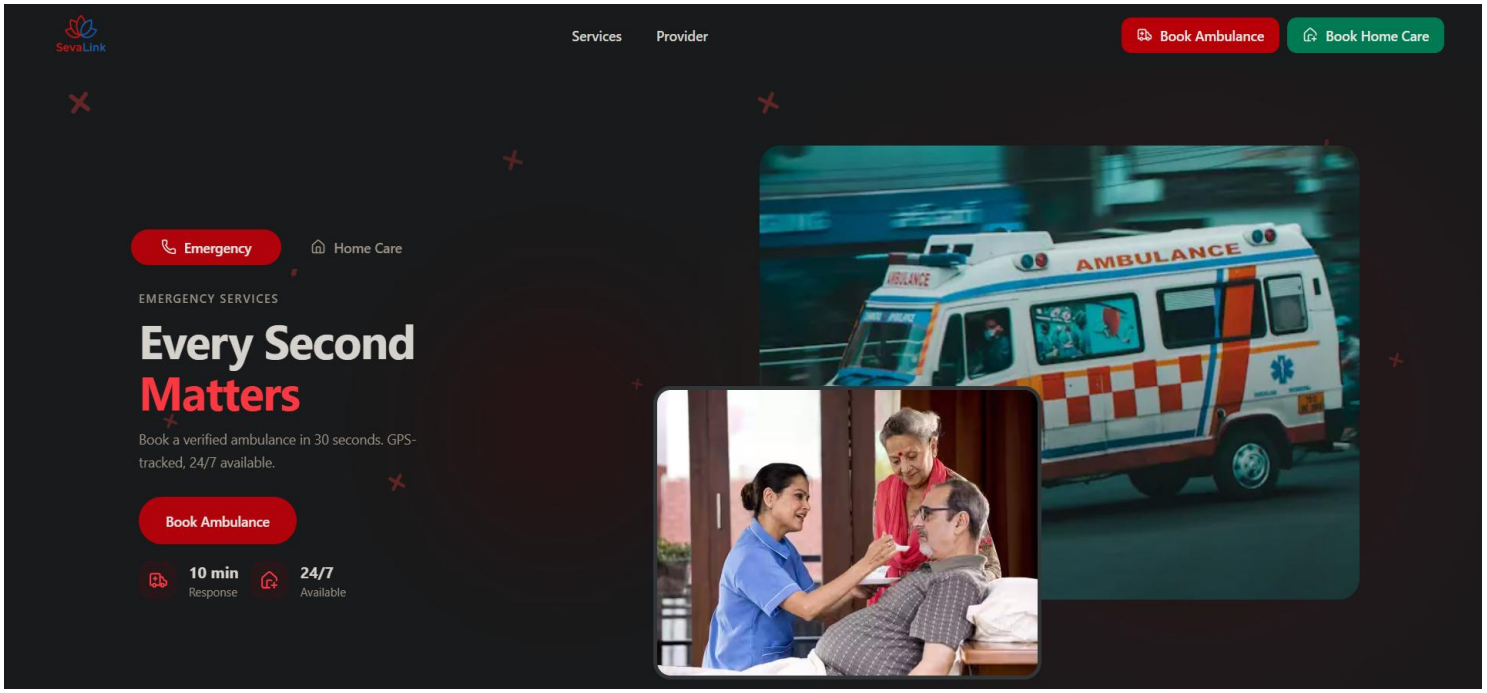
The motivation behind this project is to understand the importance of software testing, especially testing, in real-world web applications. In today's digital world, websites play a crucial role in providing services to users, and in the healthcare domain, this responsibility becomes even more critical. The **Sevalinkcare** website offers essential services such as ambulance booking and medical assistance, where any error or poor user interface can directly affect user experience and trust.

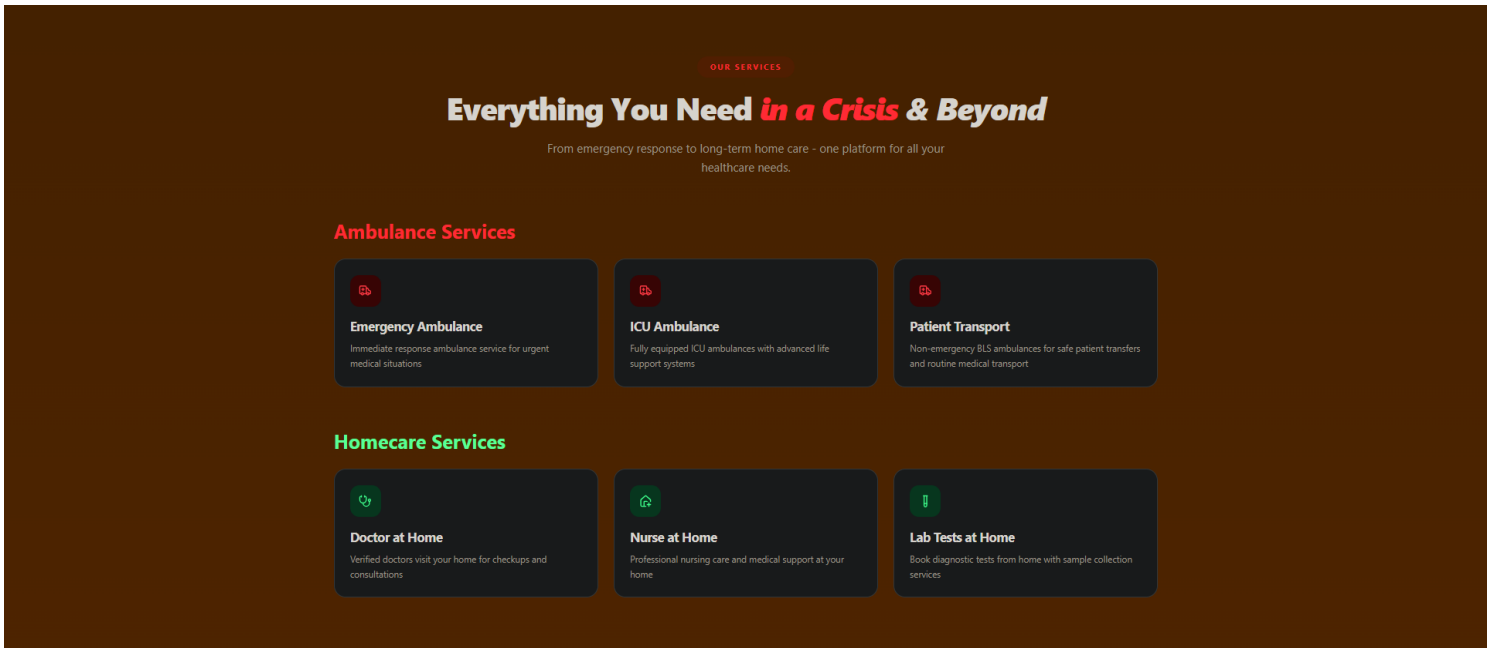
This project is motivated by the need to ensure that such platforms are user-friendly, reliable, and error-free. By performing testing, it becomes possible to identify issues related to buttons, forms, navigation, and layout that may create difficulties for users. The project also helps in understanding how small interface problems can impact the overall usability of a system.

Another important motivation is to gain practical knowledge of manual testing and test case design, which are essential skills in the field of software testing. Instead of only learning theoretical concepts, this project provides hands-on experience in identifying real-time bugs and analyzing system behavior.

Additionally, the use of Jira for bug tracking motivates the understanding of how testing is managed in real industry environments. It helps in learning how to properly document defects, track their status, and manage them efficiently throughout the testing lifecycle.

Overall, this project is driven by the goal of improving software quality and gaining practical exposure to testing tools and techniques, which are important for building a strong foundation in software testing and quality assurance.





CHAPTETR 2

SYSTEM ANALYSIS

2.1. Current Testing Process

The current testing process adopted in this project follows a structured approach that combines **manual testing with Scrum-based issue tracking using Jira**. The primary goal of this process is to ensure that all user interface elements of the **Sevalinkcare** website function correctly and provide a smooth user experience.

The process begins with understanding the overall functionality of the website and identifying key components such as forms, buttons, navigation menus, and links. Based on this understanding, a set of well-defined test cases is created to cover different user scenarios and interactions. These test cases serve as a foundation for systematic testing.

Once the test cases are prepared, manual testing is performed by interacting with the website through a web browser. Each test case is executed step-by-step, and the actual output is compared with the expected result. If the system behaves as expected, the test case is marked as pass; otherwise, it is marked as fail and considered a defect.

All identified defects are then recorded in Jira as issues (bugs). A Scrum methodology is followed where all tasks and bugs are organized into a sprint. Each bug is documented with complete details including title, description, steps to reproduce, expected result, and actual result. Additional attributes such as priority, labels, and attachments (screenshots) are also included for better clarity and tracking.

The sprint is used to manage and monitor the progress of tasks and bugs. Issues are moved across different stages such as To Do, In Progress, and Done, depending on their current status. This helps in visualizing the workflow and tracking progress effectively.
Additionally, Jira reports such as burndown charts and issue distribution graphs are used to analyze the progress of the sprint and the status of defect resolution.

Overall, the current testing process ensures a systematic and organized approach by integrating manual testing with efficient bug tracking and sprint management using Jira, thereby improving the quality and reliability of the website.

2.2. Improved Testing System

The improved testing system proposed for this project enhances the existing process by introducing a more structured, efficient, and professional approach to testing and bug management using Scrum in Jira. The aim is to improve the accuracy of testing, better organization of tasks, and faster identification and resolution of defects.

In the improved system, testing activities are planned and executed in a more systematic way using Sprint-based execution. Instead of performing testing randomly, all tasks such as test case execution, bug identification, and reporting are organized within a defined sprint. This ensures better time management and clear tracking of progress.

The test case design process is also improved by ensuring proper coverage of all possible user scenarios, including positive, negative, and edge cases. This helps in identifying more defects and increasing the overall quality of testing. Additionally, test cases are reviewed before execution to avoid missing any important functionality.

Another major improvement is in bug tracking and management using Jira. All defects are reported with detailed and standardized information, including steps to reproduce, expected and actual results, priority, and supporting screenshots. Bugs are also categorized using labels and linked to related tasks or stories, which improves traceability and organization.

The use of Scrum workflow in Jira further enhances the system by providing better visibility of work through stages such as To Do, In Progress, and Done. Regular updates of issue status help in monitoring the progress of testing activities and ensure timely completion of tasks.

Time tracking using the work log feature is also introduced to measure the effort spent on different activities such as test case creation, execution, and bug reporting. This helps in analyzing productivity and improving planning for future tasks.

Moreover, Jira reports such as burndown charts and issue analysis reports are used to evaluate sprint performance and defect trends. These reports provide valuable insights into testing efficiency and help in identifying areas of improvement.

Overall, the improved testing system provides a more organized, transparent, and efficient approach by combining structured test execution with advanced bug tracking and Scrum-based project management, leading to better software quality and reliability.

2.3. Feasibility Analysis

Feasibility analysis is an important step to evaluate whether the proposed testing project can be successfully implemented within the given constraints. In this project, feasibility is analyzed in terms of technical, operational, and time aspects to ensure effective execution of testing and bug tracking using Jira with Scrum methodology.

Technical Feasibility:- The project is technically feasible as it requires basic resources such as a computer system, internet connection, and a web browser to perform manual testing of the Sevalinkcare website. The use of Jira for bug tracking is also feasible as it is an easy-to-use and widely available tool. No complex hardware or advanced software is required, making the project simple to implement.

Operational Feasibility:-The project is operationally feasible because the testing process can be performed by a single user without the need for a large team. The workflow involving test case execution, bug identification, and issue tracking in Jira is straightforward and easy to manage. Scrum methodology further helps in organizing tasks and tracking progress efficiently through sprints.

Time Feasibility:-The project can be completed within the given time frame as the scope is limited to GUI testing and bug tracking. The use of sprint-based execution helps in dividing the work into smaller manageable tasks, ensuring timely completion of activities such as test case execution, bug reporting, and documentation.

Economic Feasibility:-The project is economically feasible as it does not require any significant financial investment. Jira provides a free version that is sufficient for this project, and all testing activities are performed manually without the need for paid tools.

CHAPTER 3

SYSTEM DESIGN AND IMPLIMENTATION

3.1. Testing Architecture

The testing architecture of this project defines the overall structure and workflow followed for performing **Testing and Analysis of SevaLinkCare website using Jira with Scrum methodology**. It provides a clear understanding of how testing activities are organized, executed, and managed throughout the project.

The architecture begins with the **test planning phase**, where the scope of testing is defined and key areas of the website such as forms, buttons, navigation menus, and links are identified. Based on this, relevant test cases are designed to cover different user scenarios and interactions.

In the next phase, **test case execution** is performed manually using a web browser. Each test case is executed step-by-step, and the system's behavior is observed. The actual results are compared with the expected results to determine whether the test case passes or fails.

If any discrepancy is found during execution, it is identified as a defect or bug. These defects are then recorded in Jira as issues. The **bug tracking system in Jira** plays a crucial role in the testing architecture by managing all identified issues in a structured manner. Each bug is documented with complete details and assigned appropriate priority and labels.

The project follows a **Scrum-based workflow**, where all tasks and bugs are organized into a sprint. The sprint acts as a container for all testing activities and helps in managing work efficiently within a fixed time frame. Issues move through different stages such as To Do, In Progress, and Done, providing clear visibility of progress.

Additionally, Jira dashboards and reports are used to monitor the status of tasks and bugs, helping in analyzing the overall testing performance. This structured flow ensures that testing activities are properly tracked and managed.

Overall, the testing architecture integrates manual test execution with systematic bug tracking and sprint management, providing an organized and efficient approach to ensure the quality and reliability of the website.

3.2. Test Module Description

The Test Module Description defines the different functional areas of the **Sevalinkcare** website that are tested during the project. Each module represents a specific part of the website, and testing is performed on these modules to ensure proper functionality, usability, and reliability of the system.

1. GUI Testing

This module focuses on testing the graphical user interface elements of the website. It includes verification of buttons, links, images, layout, and overall design consistency. The objective is to ensure that all UI components are properly aligned, visible, and functioning as expected.

1. GUI Testing					
Test Case ID	Test Case Description	Test Steps	Expected Result	Actual Result	Status
TC-01	Check homepage loading	Open website URL	Homepage should load successfully	Homepage loaded	Pass
TC-02	Check navigation menu	Click on menu options	All menu links should open correct pages	Working properly	Pass
TC-03	Verify "Book Ambulance" button	Click on book ambulance button	Redirect to booking page	Redirected	Pass
TC-04	Submit form with valid data	Fill form and submit	Form should submit successfully Submitted	Form submitted	Pass
TC-05	Service page functionality	Click on services	Services details should display	Details will be dsiplayed	Pass
TC-06	Check loading speed	Open multiple pages	Pages should load quickly	Slight delay	Pass

2. Functional Testing

Functional testing is used to validate whether the website's features are working according to the specified requirements. It includes testing actions such as button clicks, form submissions, and navigation between pages to ensure correct system behavior.

2. Functional Testing					
Test Case ID	Test Case Description	Test Steps	Expected Result	Actual Result	Status
TC-01	URL accessibility	Enter website URL in browser	Website should be accessible without error	Website opened successfully	Pass
TC-02	Form data processing	Enter valid data in contact form & submit	Data should be processed and stored/sent	Data processed successfully	Pass
TC-03	Redirection after action	Click "Contact/Book Now"	System should redirect to correct page	Redirected correctly	Pass
TC-04	Multiple submissions	Submit form multiple times	System should handle without crash	Handled properly	Pass
TC-05	Data consistency	Refresh page after submission	Data should not duplicate unintentionally	No duplication found	Pass
TC-06	Link functionality (internal)	Click internal links	Should navigate correctly without error	All links working	Pass

3. Validation Testing (with BVA)

This approach focuses on checking input fields and form validations. It ensures that the system accepts valid inputs and rejects invalid or incomplete data with proper error messages.

Phone Number: Must be exactly 10 digits

Name: Minimum 2 characters, Maximum 50 characters

Message: Minimum 10 characters, Maximum 200 characters

3. Validation Testing (with BVA)						
Test Case ID	Field Name	Input Value	Boundary Type	Expected Result	Actual Result	Pass
TC-01	Phone Number	123456789 (9 digits)	Below Boundary	Reject	Error shown	Pass
TC-02	Phone Number	1234567890 (10 digits)	Valid Boundary	Accept	Accepted	Pass
TC-03	Phone Number	12345678901 (11 digits)	Above Boundary	Reject	Rejected	Pass
TC-04	Name	A (1 char	Below Minimum	Reject	rror message shown	Pass
TC-05	Name	Ak (2 char)	Minimum Boundary	Accept	Accepted successfully	Pass
TC-06	Name	51 characters	Above Maximum	Reject	Input rejected	Pass
TC-07	Message	10 characters	Minimum boundary	Accept	Message Accept	Pass
TC-08	Message	9 chars	Below minimum	Reject	Message Reject	Pass
TC-09	Message	200 chars	Maximum boundary	Reject	Message Reject	Pass

4. Usability Testing

Usability testing is performed to evaluate how easy and user-friendly the website is. It checks whether users can navigate the website easily and complete tasks without confusion.

4. Usability Testing					
Test Case ID	Test Case Scenario	Test Description	Expected Result	Actual Result	Status
TC_01	Navigation clarity	Check menu structure	Easy to understand	Navigation is simple	Pass
TC_02	Readability	Check font size & color	Text should be readable	Text clearly visible	Pass
TC_03	Button visibility	Check CTA buttons	Clearly visible	Buttons clearly visible	Pass
TC_04	Page loading	Check speed	Load within 3–5 sec	Loaded in 3 sec	Pass
TC_05	User flow	Booking process	Simple and smooth	Process is smooth	Pass
TC_06	Error messages	Wrong input	Clear error message	Messages are clear	Pass

5. Responsiveness Testing

This approach ensures that the website adapts properly to different screen sizes and devices such as desktops and mobile phones. It verifies that the layout remains consistent and usable across platforms.

5. Responsiveness Testing					
Test Case ID	Device	Resolution	Expected Result	Actual Result	Status
TC_01	Desktop	1920x1080	Proper layout	Layout correct	Pass
TC_02	Laptop	1366x768	No distortion	UI looks fine	Pass
TC_03	Tablet	768x1024	Responsive UI	Adjusted properly	Pass
TC_04	Mobile	375x667	Mobile friendly	UI responsive	Pass
TC_05	Small Mobile	320px	Content adjusts	Content fits screen	Pass
TC_06	Orientation	Portrait/Landscape	Layout adapts	Works correctly	Pass

3.3. Technology Stack

The technology stack used in this project includes the tools and technologies required to perform manual GUI testing and bug tracking using Jira with Scrum methodology. The selected tools are simple, efficient, and suitable for executing and managing the testing process.

1. Web Browser

A web browser such as Google Chrome or Microsoft Edge is used to access and test the Sevalinkcare website. It is used for executing test cases, interacting with the user interface, and observing system behavior during testing.

2. Jira (Bug Tracking Tool)

Jira is used as the primary tool for issue tracking and project management. It helps in creating and managing bugs, organizing tasks, and tracking progress using Scrum methodology. Features such as sprint planning, issue status tracking, labels, and reports are utilized for efficient defect management.

3. Manual Testing Techniques

Manual testing is used to validate the functionality and usability of the website. Test cases are executed manually without using automation tools, allowing detailed observation of GUI elements and user interactions.

4. Spreadsheet Tool (MS Excel)

A spreadsheet tool is used to design and maintain test cases. It helps in organizing test case details such as test case ID, description, steps, expected results, and actual results in a structured format.

5. System Environment

The testing is performed on a standard computer system with an internet connection. The environment includes a desktop or laptop with basic hardware configuration sufficient to run a web browser and access Jira.

6. Cross-Browser Testing Tools

Used to verify that the website works consistently across different browsers such as Chrome, Edge, and Firefox, ensuring compatibility and performance.

3.4. Results

The results of this project are based on the execution of test cases and the analysis of defects identified during the **Testing and Analysis of Sevalinkcare** website. A total of multiple test cases were designed and executed to evaluate different aspects of the website, including user interface, functionality, form validation, and navigation.

During the testing process, most of the test cases were successfully passed, indicating that several features of the website are functioning correctly. However, some test cases failed due to issues such as improper input validation, non-functional links, and form submission errors. These failed test cases were identified as defects and were recorded as bugs in Jira for further tracking and management.

The use of Jira helped in organizing and managing all identified issues efficiently. Bugs were categorized based on priority and severity, and their status was tracked through different stages such as To Do, In Progress, and Done. This provided a clear view of the testing progress and defect resolution status.

The sprint-based approach using Scrum allowed better management of testing activities by grouping tasks and bugs into a structured workflow. It also helped in monitoring the progress using Jira reports such as burndown charts and issue tracking graphs.

Overall, the results indicate that while the website performs well in several areas, there are certain issues that need improvement to enhance user experience and system reliability. The testing process successfully identified these issues and provided a clear path for their resolution through effective bug tracking and management.

CHAPTER 4

CONCLUSION AND FUTURE WORK

4.1. Conclusion

This project focused on the **Testing and Analysis of SevaLinkCare website using manual testing techniques and Jira with Scrum methodology**. The primary objective was to evaluate the functionality, usability, and overall performance of the website and to ensure that it provides a smooth and reliable user experience.

During the project, test cases were designed and executed to systematically test different components of the website such as forms, buttons, navigation, and layout. The testing process helped in identifying both functional and usability issues. Several defects were discovered, particularly in areas like input validation, form submission, and navigation.

All identified defects were effectively managed using Jira, where they were recorded as issues with proper details and tracked through different stages. The use of Scrum methodology, including sprint-based execution, helped in organizing the workflow and monitoring progress efficiently.

The project provided practical knowledge of software testing concepts such as manual testing, GUI testing, test case design, and bug tracking. It also demonstrated the importance of structured testing and proper issue management in improving software quality.

In conclusion, the project successfully achieved its objectives by identifying key issues in the website and demonstrating an effective approach to testing and defect management. It highlights the significance of testing in delivering high-quality, user-friendly web applications, especially in critical domains like healthcare.

4.2. Future Enhancement

Although the current project successfully performs **Testing and Analysis of SevaLinkCare and bug tracking using Jira**, there are several areas where the system can be further enhanced to improve efficiency, accuracy, and overall testing quality.

One major enhancement is the introduction of **automation testing**. Instead of relying only on manual testing, automated tools can be used to execute repetitive test cases quickly and accurately. This will save time and increase test coverage.

Another improvement can be the integration of **cross-browser and cross-device testing tools** to ensure that the website performs consistently across different browsers and devices. This will enhance the reliability and user experience of the application.

The project can also be extended by implementing **performance testing**, which will help in analyzing the speed, responsiveness, and stability of the website under different conditions. This is especially important for healthcare websites where quick response time is critical.

Additionally, the use of **advanced Jira features** such as custom workflows, detailed dashboards, and automation rules can further improve bug tracking and project management. This will make the process more efficient and professional.

Another possible enhancement is improving **test case management** by using dedicated tools instead of spreadsheets. This will help in better organization, version control, and tracking of test cases.

Finally, the project can be expanded by including **security testing** to ensure that user data is protected and the system is secure from potential threats.
